PatentClaw
OpenClaw Agentic AI for Patent Professionals

Thomas Plunkett

The Routine Burden of Intellectual Property Work

Manual Overload

Attorneys are consumed by repetitive drafting and status monitoring, diverting elite legal expertise toward administrative tasks rather than high-value strategy.

The Privacy Paradox

Patent data sensitivity prohibits Public Cloud use, yet manual on-premise workflows cannot scale to meet the projected 2026 filing volume.

Reactive Practice

Human-dependent monitoring leads to missed deadlines and "surprise" competitor filings, placing IP portfolios in a perpetual state of defensive remediation.

Autonomous Agents. Local Hardware. Absolute Security.

Agentic Automation

Beyond chatbots. Our agents act—monitoring dockets, drafting claims, and filing documents.

Sovereign Execution

Sensitive data never leaves the firm’s physical office.

Proactive Intelligence

"Heartbeat" agents that work 24/7 without being prompted.

Why Does This Matter?

The Patent Attorney Perspective

Prior Art Analysis

AI can analyze and compare claims versus the prior art to identify differences and similarities.

Automated Proofreading

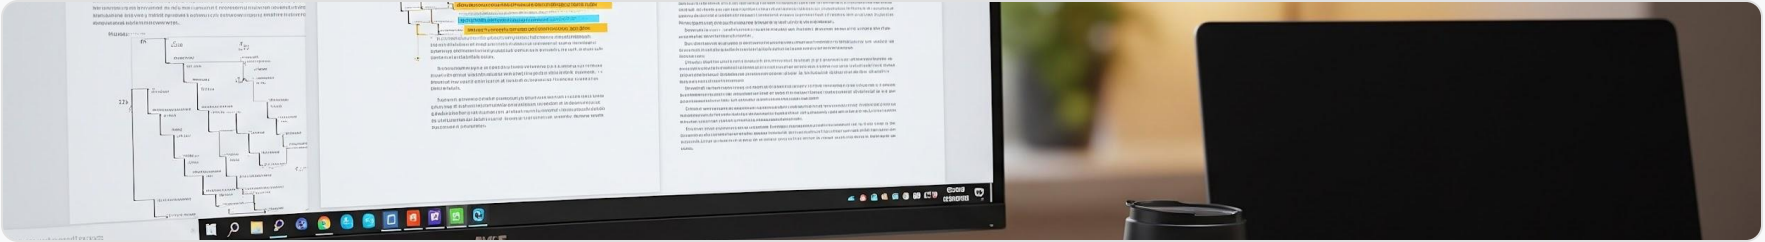
Proofreading is always helpful, ensuring consistency and technical accuracy throughout the filing.

Enhanced Drafting

When drafting a new patent application, can describe features in greater detail for robust protection.

Oversight & Review

Assists the review process where documents from junior professionals are reviewed by senior partners.



Your Digital Patent Workforce

The Monitor
Proactively tracks USPTO status and competitor activity.

The Drafter
Synthesizes technical disclosures into jurisdictional-ready patent specifications.

The Clerk
Automates docketing, email reconciliation, and file management.

Interface
A simple web UI for "Human-in-the-Loop" approval of agent actions.

How It Works (The Tech Stack)

Small Footprint, Giant Reasoning

Compute
HP ZGX Nano AI Station
1,000 TOPS / 128GB Unified Memory

The Brain
gpt-oss-120b via Ollama
MXFP4 Quantization for local frontier reasoning

Orchestrator
OpenClaw Framework
Multi-agent coordination & tool-use

Deployment
NVIDIA OpenClaw DGX Playbook
Secure integrated blueprint

Security & Safety

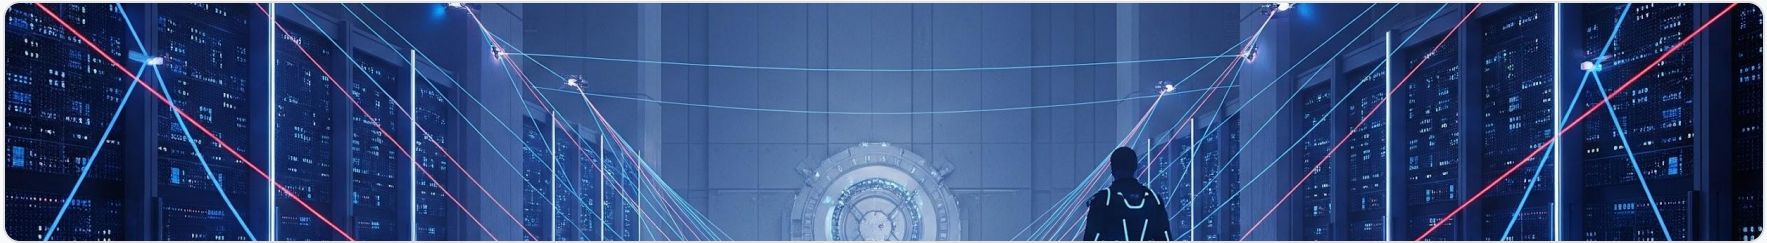
Built for the Zero-Trust Legal Environment

Kernel Isolation
NVIDIA OpenShell sandboxing ensures agents only access approved local directories.

Network Egress Control
Hard-coded blocks on external data transfers—confidentiality is baked into the OS.

Auditability
Full "Chain-of-Thought" logging for every decision made by the agent.

E-Stop
Instant local "Kill Switch" for all autonomous processes.



Technical Novelty

Why This Is Hard to Replicate

Model Density

Running a 120B parameter model on a desk-side station using advanced bit-scaling (MXFP4).

Long-Horizon Planning

Stateful agents that maintain context over month-long patent prosecution cycles.

Domain-Specific RAG

Custom "Legal-NLP" embeddings that understand structural claim dependencies better than general AI.
